Fluid Solver

Implementation and Results

Governing Equations

• The general equation governing fluid dynamics is the **Navier-Stokes** equation:

$$\rho\left(\frac{\partial \mathbf{u}}{\partial t} + (\mathbf{u} \cdot \nabla)\mathbf{u}\right) = -\nabla \rho + \nabla \cdot \mathbb{T} + \mathbf{f}.$$

イロト イポト イヨト イヨト 三日

Fluid Solver

Implementation and Results

Governing Equations

• The general equation governing fluid dynamics is the **Navier-Stokes** equation:

$$\rho\left(\frac{\partial \mathbf{u}}{\partial t} + (\mathbf{u} \cdot \nabla)\mathbf{u}\right) = -\nabla \rho + \nabla \cdot \mathbb{T} + \mathbf{f}.$$

 In many cases we are only interested in *incompressible flow*. Assumption that ∇ · **u** = 0 leads to simpler equation:

$$\rho\left(\frac{\partial \mathbf{u}}{\partial t} + (\mathbf{u} \cdot \nabla)\mathbf{u}\right) = -\nabla \rho + \mu \nabla^2 \mathbf{u} + \mathbf{f}.$$

Introduction	Fluid Solver ○●○○○○○○○○○	Implementation and Results		
	Method			

• We treat the mesh triangles/tetrahedra as *conforming*, linear elements. Hence, the velocity field is defined as:

$$\mathbf{u}(\mathbf{x}) = \sum_{i=1}^{N_V} \mathbf{u}_i \cdot \phi_i(\mathbf{x}),$$

where N_V is the number of vertices and ϕ_i is the linear interpolant (*hat* function).

Introduction	Fluid Solver	Implementation and Results		

Method

• We treat the mesh triangles/tetrahedra as *conforming*, linear elements. Hence, the velocity field is defined as:

$$\mathbf{u}(\mathbf{x}) = \sum_{i=1}^{N_V} \mathbf{u}_i \cdot \phi_i(\mathbf{x}),$$

where N_V is the number of vertices and ϕ_i is the linear interpolant (*hat* function).

• Our solver resembles fractional step method in the sense that we separate advection from the other terms.

Introduction	Fluid Solver	Implementation and Results	

Method

• We treat the mesh triangles/tetrahedra as *conforming*, linear elements. Hence, the velocity field is defined as:

$$\mathbf{u}(\mathbf{x}) = \sum_{i=1}^{N_V} \mathbf{u}_i \cdot \phi_i(\mathbf{x}),$$

where N_V is the number of vertices and ϕ_i is the linear interpolant (*hat* function).

- Our solver resembles fractional step method in the sense that we separate advection from the other terms.
- Advection is performed in purely Lagrangian way: velocity values "travel" together with the vertices.

Incompressibility

• We aim at keeping the velocity field divergence-free in each element:

$$abla \cdot \mathbf{u} = \sum_{i=1}^{N_V} \mathbf{u}_i \cdot
abla \phi_i(\mathbf{x}) = 0.$$

 $\nabla \phi_i$ is constant over every element.

イロト イポト イヨト イヨト 三日

Incompressibility

• We aim at keeping the velocity field divergence-free in each element:

$$abla \cdot \mathbf{u} = \sum_{i=1}^{N_V} \mathbf{u}_i \cdot \nabla \phi_i(\mathbf{x}) = \mathbf{0}.$$

 $\nabla \phi_i$ is constant over every element.

• By putting together incompressibility conditions for all tetrahedra we obtain a system of linear equations:

where **P** is a discrete divergence operator (matrix).

・ロト ・ 同ト ・ ヨト ・ ヨト - ヨ

SOR

Implementation and Results

Incompressibility

• Since the velocity field $\tilde{\mathbf{u}}$ after the advection step might not be divergence-free, we introduce pressure field **p**, such that:

$$\mathbf{u} = \tilde{\mathbf{u}} + \mathbf{M}^{-1} \mathbf{P}^{T} \mathbf{p},$$

where \boldsymbol{u} is divergece-free and \boldsymbol{M} is the lumped mass matrix.

Incompressibility

• Since the velocity field $\tilde{\mathbf{u}}$ after the advection step might not be divergence-free, we introduce pressure field **p**, such that:

$$\mathbf{u} = \tilde{\mathbf{u}} + \mathbf{M}^{-1} \mathbf{P}^{T} \mathbf{p},$$

where **u** is divergece-free and **M** is the lumped mass matrix.

• Incompressibility condition **Pu** = **0** yields that:

$$(\mathbf{P}\mathbf{M}^{-1}\mathbf{P}^{T})\mathbf{p} = -\mathbf{P}\tilde{\mathbf{u}}.$$

Surface Tension

• In order to make our fluid simulation more plausible we include *surface tension*. Surface tension is derived from surface energy *U* defined as:

$$U=\gamma A$$
,

where γ is the surface energy density (material constant) and *A* is the free surface area.

・ロト ・ 同ト ・ ヨト ・ ヨト - ヨ

SOR

Surface Tension

• In order to make our fluid simulation more plausible we include *surface tension*. Surface tension is derived from surface energy *U* defined as:

$$U=\gamma A$$
,

where γ is the surface energy density (material constant) and *A* is the free surface area.

• Surface tension forces alone yield a highly divergent velocity field and our experiments have shown that integrating them before enforcing incompressibility step can give very poor results.

Fluid Solver

Implementation and Results

Optimization-based Approach

 In order to correctly incorporate surface tension forces we fully couple them with incompressibility by solving the optimization problem:

minimize
$$\frac{1}{2}(\mathbf{u} - \tilde{\mathbf{u}})^T \mathbf{M}(\mathbf{u} - \tilde{\mathbf{u}}) + U(\mathbf{x} + \mathbf{u}\Delta t),$$

subject to $\mathbf{P}\mathbf{u} = \mathbf{0},$

where U is the surface energy.

・ロト ・ 雪 ト ・ ヨ ト ・

Optimization-based Approach

 In order to correctly incorporate surface tension forces we fully couple them with incompressibility by solving the optimization problem:

minimize
$$\frac{1}{2}(\mathbf{u} - \tilde{\mathbf{u}})^T \mathbf{M}(\mathbf{u} - \tilde{\mathbf{u}}) + U(\mathbf{x} + \mathbf{u}\Delta t),$$

subject to
$$\mathbf{P}\mathbf{u} = \mathbf{0},$$

where *U* is the surface energy.

• The optimization problem is consistent, as the 1st order KKT condition is the backward Euler step:

$$\mathbf{u} = \tilde{\mathbf{u}} + \Delta t \mathbf{M}^{-1} \nabla U(\mathbf{u}) + \mathbf{M}^{-1} \mathbf{P}^T \mathbf{p},$$

where the pressure **p** plays the role of Lagrange multipliers.

Optimization-based Approach contd.

• By using the second order approximation of surface energy:

$$U(\mathbf{x} + \mathbf{u}\Delta t) \approx U(\mathbf{x}) + \Delta t \nabla U \cdot \mathbf{u} + \frac{\Delta t^2}{2} \mathbf{u}^T \nabla^2 U \mathbf{u}$$

we can further simplify the optimization problem to the form:

minimize
$$\frac{1}{2}\mathbf{u}^{T}(\mathbf{M} + \Delta t^{2}\nabla^{2}U)\mathbf{u} + (-\tilde{\mathbf{u}}^{T}\mathbf{M} + \Delta t\nabla U)\mathbf{u},$$
subject to
$$\mathbf{P}\mathbf{u} = \mathbf{0},$$

Optimization-based Approach contd.

• By using the second order approximation of surface energy:

$$U(\mathbf{x} + \mathbf{u}\Delta t) \approx U(\mathbf{x}) + \Delta t \nabla U \cdot \mathbf{u} + \frac{\Delta t^2}{2} \mathbf{u}^T \nabla^2 U \mathbf{u}$$

we can further simplify the optimization problem to the form:

minimize
$$\frac{1}{2}\mathbf{u}^{T}(\mathbf{M} + \Delta t^{2}\nabla^{2}U)\mathbf{u} + (-\tilde{\mathbf{u}}^{T}\mathbf{M} + \Delta t\nabla U)\mathbf{u},$$

subject to
$$\mathbf{P}\mathbf{u} = \mathbf{0},$$

• Now we can write the 1st order KKT condition as:

$$(\mathbf{M} + \Delta t^2 \nabla^2 U) \mathbf{u} + \mathbf{P}^T \mathbf{p} = \mathbf{M} \tilde{\mathbf{u}} - \Delta t (\nabla U)^T.$$

・ロト ・ 同ト ・ ヨト ・ ヨト - ヨ

• Note that the KKT matrix is indefinite.

(ロ)

Implementation and Results

Locking

Locking means inability of a given finite element space to offer good approximate solutions, due to the fact that volume constraint on each tetrahedron may leave us with a solution space of very low dimension.

<ロ> <同> <同> < 同> < 同>

Fluid Solver

Implementation and Results

Pressure Stabilization

• To prevent it, we add a pressure stabilization term **S** to the equation:

$$\begin{bmatrix} \mathbf{A} & \mathbf{P}^{\mathsf{T}} \\ \mathbf{P} & -\mathbf{S} \end{bmatrix} \begin{bmatrix} \mathbf{u} \\ \mathbf{p} \end{bmatrix} = \begin{bmatrix} \mathbf{b} \\ \mathbf{0} \end{bmatrix}.$$
(1)

such that:

$$\mathbf{S}_{ij} = \begin{cases} -\delta \cdot \mathbf{a}_{ij} & \text{if } i \neq j \\ \delta \cdot \sum_{k \neq i} \mathbf{a}_{ik} & \text{if } i = j \end{cases},$$
(2)

・ロト ・ 同ト ・ ヨト ・ ヨト - ヨ

where δ is a positive stabilization parameter and a_{ij} is the area of the face shared by tetrahedra *i* and *j*.

Pressure Stabilization

• To prevent it, we add a pressure stabilization term **S** to the equation:

$$\begin{bmatrix} \mathbf{A} & \mathbf{P}^{\mathsf{T}} \\ \mathbf{P} & -\mathbf{S} \end{bmatrix} \begin{bmatrix} \mathbf{u} \\ \mathbf{p} \end{bmatrix} = \begin{bmatrix} \mathbf{b} \\ \mathbf{0} \end{bmatrix}.$$
(1)

such that:

$$\mathbf{S}_{ij} = \begin{cases} -\delta \cdot \mathbf{a}_{ij} & \text{if } i \neq j \\ \delta \cdot \sum_{k \neq i} \mathbf{a}_{ik} & \text{if } i = j \end{cases},$$
(2)

・ロト ・ 同ト ・ ヨト ・ ヨト - ヨ

where δ is a positive stabilization parameter and a_{ij} is the area of the face shared by tetrahedra *i* and *j*.

• Such stabilization term smoothens the pressure field in exchange for slight violation of incompressibility constraint, while globally preserving volume.

Pressure Stabilization

• To prevent it, we add a pressure stabilization term **S** to the equation:

$$\begin{bmatrix} \mathbf{A} & \mathbf{P}^{\mathsf{T}} \\ \mathbf{P} & -\mathbf{S} \end{bmatrix} \begin{bmatrix} \mathbf{u} \\ \mathbf{p} \end{bmatrix} = \begin{bmatrix} \mathbf{b} \\ \mathbf{0} \end{bmatrix}.$$
(1)

such that:

$$\mathbf{S}_{ij} = \begin{cases} -\delta \cdot \mathbf{a}_{ij} & \text{if } i \neq j \\ \delta \cdot \sum_{k \neq i} \mathbf{a}_{ik} & \text{if } i = j \end{cases},$$
(2)

where δ is a positive stabilization parameter and a_{ij} is the area of the face shared by tetrahedra *i* and *j*.

- Such stabilization term smoothens the pressure field in exchange for slight violation of incompressibility constraint, while globally preserving volume.
- In our simulations $\delta = \Delta t \cdot k^2$, where k is the speed of sound in the medium.

Fluid Solver

Implementation and Results

Solid boundaries

Solid boundaries put extra constraints on vertex velocity values. If the vertex v_i is in contact with the solid, we force its normal coordinate to match the normal coordinate of the solid velocity at the point of collision.

- Unfortunatelly, the complexity of Cholesky decomposition for sparse matrices is at best $O(n^{3/2})$, where *n* is the size of the matrix. This way, solving the KKT system quickly becomes the bottleneck.
- In order to avoid that we have recently switched the method to an iterative one: generalized minimal residual (GMRES) method.
- We are using CUDA-based implementation of GMRES, available in CUSP library.
- In order to improve the conditioning of the system, we multiply A and b by:

Sac

Preconditioning

- Let us consider a linear system $\mathbf{K}\mathbf{x} = \mathbf{c}$
- The convergence rate of many iterative solvers depends on the condition number κ of the matrix K:

$$\kappa = \left| rac{\lambda_{\max}(\mathbf{K})}{\lambda_{\min}(\mathbf{K})}
ight|,$$

where λ_{max} and λ_{min} are the maximum and minimum (by moduli) eigenvalues of K.

Preconditioning

- Let us consider a linear system $\mathbf{K}\mathbf{x} = \mathbf{c}$
- The convergence rate of many iterative solvers depends on the condition number κ of the matrix K:

$$\kappa = \left|rac{\lambda_{\max}(\mathbf{K})}{\lambda_{\min}(\mathbf{K})}
ight|,$$

where λ_{max} and λ_{min} are the maximum and minimum (by moduli) eigenvalues of K.

• We can improve the condition number of the system by applying a preconditioner **T**:

$$\mathbf{T}\mathbf{K}\mathbf{x} = \mathbf{T}\mathbf{c}$$

Preconditioning

- Let us consider a linear system $\mathbf{K}\mathbf{x} = \mathbf{c}$
- The convergence rate of many iterative solvers depends on the condition number κ of the matrix K:

$$\kappa = \left| rac{\lambda_{\max}(\mathbf{K})}{\lambda_{\min}(\mathbf{K})}
ight|,$$

where λ_{max} and λ_{min} are the maximum and minimum (by moduli) eigenvalues of K.

• We can improve the condition number of the system by applying a preconditioner **T**:

$$\mathbf{T}\mathbf{K}\mathbf{x} = \mathbf{T}\mathbf{c}$$
.

• For our KKT system we are using the diagonal approximation of Murphy's block preconditioner (based on the Schur complement method):

$$\mathbf{T}^{-1} = \begin{bmatrix} \operatorname{diag}(\mathbf{M}) & \mathbf{0} \\ \mathbf{0} & \operatorname{diag}(\mathbf{P}^{\mathsf{T}}\mathbf{M}^{-1}\mathbf{P} + \mathbf{S}) \end{bmatrix}$$

$$(\Box \succ \langle \Box \rangle \land \langle \Box \rangle \land \langle \Box \rangle \rangle$$
