## Affine independence

### Definition (affine independce)

Let  $\mathbf{v}_1, \dots, \mathbf{v}_{p+1}$  be points in an *n*-dimensional Euclidean space  $E^n$ . We call them *affinely dependent* if

$$(\exists \mu_1,\ldots,\mu_{p+1}\in\mathbb{R})\sum_{i=1}^{p+1}\mu_i=1\wedge\sum_{i=1}^{p+1}\mu_i\mathbf{v}_i=0.$$

Otherwise, we call them affinely independent.

#### Examples:

- three non-colinear points in E<sup>2</sup> are affinely independent;
- four non-coplanar points in  $E^3$  are affinely independent;

・ロト ・ 同ト ・ ヨト ・ ヨト

## Simplex

### Definition (Euclidean simplex)

Having p + 1 affinely independent points  $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_{p+1} \in E^n$ , an *Euclidean simplex*  $\sigma = \langle \mathbf{v}_1, \dots, \mathbf{v}_{p+1} \rangle$  is a set of points given by a formula:

$$\mathbf{v} = \alpha_1 \mathbf{v}_1 + \ldots + \alpha_{p+1} \mathbf{v}_{p+1},$$

where  $\alpha_i \ge 0$ ,  $\sum_i \alpha_i = 1$  ( $\sigma$  is the *convex hull* of  $\mathbf{v}_1, \ldots, \mathbf{v}_{p+1}$ ).

Star

#### Definition (star)

We define the *star* of a simplex  $\sigma$  as a set of all the simplices in K, which have  $\sigma$  as a face:

$$\operatorname{st}(\sigma^p) = \{\sigma \in \mathsf{K} : \operatorname{vert}(\sigma^p) \subset \operatorname{vert}(\sigma)\} = \bigcup_{q=p+1}^n C_{p,q}(\sigma^p).$$

For the sake of convenience, we also define a star of an arbitrary subset  $\Sigma$  of K, as the union of the stars of all simplices in  $\Sigma$ :

$$\operatorname{st}(\Sigma) = \bigcup_{\sigma_i \in \Sigma} \operatorname{st}(\sigma_i).$$

### Closure

#### **Definition (closure)**

We define the *closure* of a simplex  $\sigma^{\rho} \in K$  as a set

$$\mathrm{cl}(\sigma^{p}) = igcup_{q=0}^{p} B_{p,q}(\sigma^{p}).$$

The closure of a simplex set  $\Sigma \subset K$  is expressed as a set

$$\operatorname{cl}(\Sigma) = igcup_{\sigma_i \in \Sigma} \operatorname{cl}(\sigma_i).$$

Equivalently, we can define the closure of a simplex  $\sigma \in K$  (simplex set  $\Sigma \subset K$ ) as the smallest subcomplex of K containing  $\sigma$  (including  $\Sigma$ ).

### Carrier

#### Definition

The *carrier* ||K|| of a simplicial complex K (also called the *polyhedron* ||K||) is a subset of  $E^n$  defined by the union, as point sets, of all the simplices in K.

#### Definition

For each point  $v \in ||K||$  there exists exactly one simplex  $\sigma \in K$  containing v in its relative interior. This simplex is denoted by supp(v) and called the *support* of the point v.

・ロト ・ 同ト ・ ヨト ・ ヨト

Implementation

### Manifoldness

### Definition (notion of manifoldness)

We say that a point  $\mathbf{v} \in A \subset E^n$  is *p*-manifold if there exists a neighbourhood U of v such that  $A \cap U$  is homeomorphic to  $\mathbb{R}^p$  or  $\mathbb{R}^{(p-1)} \times (0, +\infty)$ . Otherwise we call  $\mathbf{v}$  non-manifold.

We say that a simplex  $\sigma \in K$  is *p*-manifold, if every point of the relative interior of this simplex is *p*-manifold with regard to the carrier of K. E.g. obviously each *n*-simplex is *n*-manifold, each (n-1)-simplex is *n*-manifold if it is a face of at least one *n*-simplex, etc.

We also say that an *n*-dimensional simplicial complex K in  $E^n$  is manifold, if each of its simplices is *n*-manifold.

### Manifoldness

M. K. Misztal Simplicial Complexes: Theory and Implementation

<ロト <回 > < 回 > < 回 > < 回 > <

Ξ.

Implementation

SOR

### Orientations

We introduce the following equivalence relation in the set  $P_{\sigma}$  of all orderings  $(\mathbf{v}_{i_1}, \dots, \mathbf{v}_{i_{p+1}})$  of the vertices of  $\sigma = \langle \mathbf{v}_1, \dots, \mathbf{v}_{p+1} \rangle$ :

$$(\mathbf{v}_{i_1},\ldots,\mathbf{v}_{i_{p+1}})\sim (\mathbf{v}_{\pi(i_1)},\ldots,\mathbf{v}_{\pi(i_{p+1})})$$

iff  $\pi : \{1, 2, \dots, p+1\} \longrightarrow \{1, 2, \dots, p+1\}$  is an even permutation operator.

We call each element of the quotient set  $\mathcal{O}_{\sigma} = P_{\sigma} / \sim$  an *orientation* of a simplex  $\sigma$ .

If p > 0,  $|\mathcal{O}_{\sigma}| = 2$ , meaning that there are two possible orientations for any simplex defined on a set of p+1 points from  $E^n$ .

イロト イポト イヨト イヨト 三日

Meshes

Implementation

### **Oriented volume**

We define an *oriented volume* of  $\sigma = [\mathbf{v}_1, \dots, \mathbf{v}_{p+1}]$ 

$$\begin{aligned} \mathscr{V}(\sigma) &= \mathscr{V}(\mathbf{v}_1, \dots, \mathbf{v}_{p+1}) \\ &= \frac{1}{p!} \det(\mathbf{v}_1 - \mathbf{v}_2, \mathbf{v}_2 - \mathbf{v}_3, \dots, \mathbf{v}_p - \mathbf{v}_{p+1}, \mathbf{v}_{p+1} - \mathbf{v}_1). \end{aligned}$$

It can be proven, that for an even permutation operator  $\pi$ 

$$\mathscr{V}(\mathbf{v}_{\pi(1)},\ldots,\mathbf{v}_{\pi(p+1)})=\mathscr{V}(\mathbf{v}_1,\ldots,\mathbf{v}_{p+1}),$$

and for an odd permutation operator  $\pi'$ 

$$\mathscr{V}(\mathbf{v}_{\pi'(1)},\ldots,\mathbf{v}_{\pi'(\rho+1)}) = -\mathscr{V}(\mathbf{v}_1,\ldots,\mathbf{v}_{\rho+1}),$$

### **Tetrahedral meshes**

#### Definition (tetrahedral mesh)

A dimension 3 simplicial complex  $K \subset E^n$  (where  $n \ge 3$ ), such that every 0, 1 or 2-simplex  $\sigma \in K$  is a face of a 3-simplex  $\sigma^3 \in K$  is called a *tetrahedral mesh*.

Tetrahedral meshes inherit the notions of manifoldness and orientability from simplicial complexes.

Triangle mesh operations generalize (although not always easily) to tetrahedral meshes.

Meshes

Implementation

### Our implementation

- Our implementation of the IS data structure is restricted to simplicial complexes of dimension three or less.
- Our implementation is orientation-aware: we identify an oriented simplex σ<sup>ρ</sup> with an *ordered* tuple of its (p-1)-faces:

$$\left[\sigma_1^{p-1},\ldots,\sigma_{p+1}^{p-1}\right],$$

which implies:

$$\sigma^{p} = \Big[ \operatorname{vert}(\sigma^{p}) / \operatorname{vert}(\sigma_{1}^{p-1}), \dots, \operatorname{vert}(\sigma^{p}) / \operatorname{vert}(\sigma_{p+1}^{p-1}) \Big],$$

where:

$$\operatorname{vert}(\sigma^d) = \bigcup_{i=1}^{d+1} \operatorname{vert}(\sigma_i^{d-1}),$$

Simplicial Complexes: Theory and Implementation

・ロッ ・雪 ・ ・ ヨ ・ ・

Implementation

### Our implemetation

It can be seen that:

- $C^*_{2,3}(\sigma^2) = C_{2,3}(\sigma^2)$ ,
- if  $\sigma^p$  (p < 2) is 3-manifold, then  $|C^*_{p,p+1}(\sigma^p)| = 1$ .
