Dijkstra's Algorithm

Shortest Paths on DAGs

- Shortest paths. Given a directed, weighted graph G and vertex s, find shortest path from s to all vertices in G.
- Shortest path tree. Represent shortest paths in a tree from s.

#### Applications

• Routing, scheduling, pipelining, ...

## Properties of Shortest Paths

- Assume for simplicity:
  - All vertices are reachable from s.

## Properties of Shortest Paths

- Subpath property. Any subpath of a shortest path is a shortest path.
- Proof.
  - Consider shortest path from s to t consisting of  $p_1$ ,  $p_2$  and  $p_3$ .

p<sub>3</sub> (v)

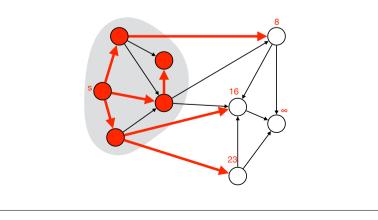

- Assume q<sub>2</sub> is shorter than p<sub>2</sub>.
- $\implies$  Then  $p_1$ ,  $q_2$  and  $p_3$  is shorter than p.

### Dijkstra's Algorithm

- Initialize s.d = 0 and v.d =  $\infty$  for all vertices  $v \in V \setminus \{s\}$ .
- Grow tree T from s.
- In each step, add vertex with smallest distance estimate to T.
- Relax all outgoing edges of v.

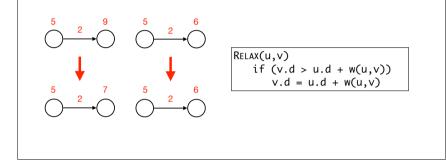

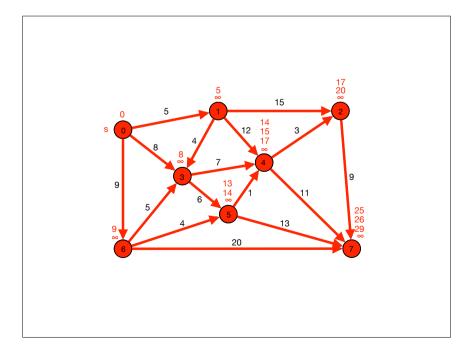

#### Dijkstra's Algorithm

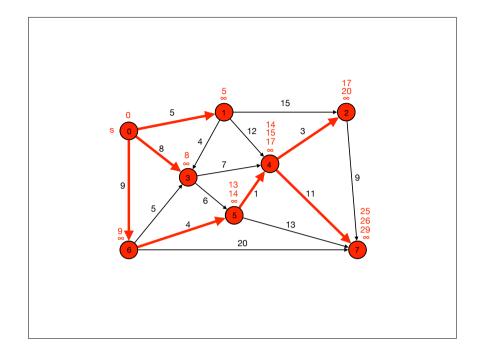

• Goal. Given a directed, weighted graph with non-negative weights and a vertex s, compute shortest paths from s to all vertices.

#### • Dijkstra's algorithm.

- Maintains distance estimate v.d for each vertex v = length of shortest known path from s to v.
- Updates distance estimates by relaxing edges.

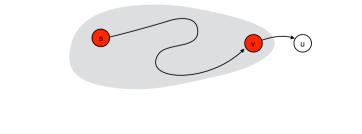

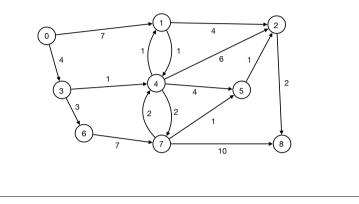

#### Dijkstra's Algorithm

- Lemma. Dijkstra's algorithms computes shortest paths.
- Proof.
  - Consider some step after growing tree T and assume distances in T are correct.
  - Consider closest vertex u of s not in T.
  - Shortest path from s to u ends with an edge (v,u).
  - v is closer than u to s  $\implies$  v is in T. (u was closest not in T)
  - $\implies$  shortest path to u is in T except last edge (u,v).
  - Dijkstra adds (u,v) to  $T \Longrightarrow T$  is shortest path tree after n-1 steps.

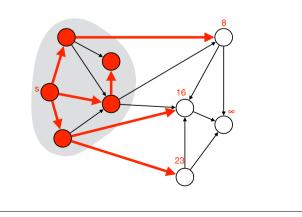

## Dijkstra's Algorithm

- Initialize s.d = 0 and v.d =  $\infty$  for all vertices  $v \in V \setminus \{s\}$ .
- Grow tree T from s.
- In each step, add vertex with smallest distance estimate to T.
- Relax all outgoing edges of v.
- Exercise. Show execution of Dijkstra's algorithm from vertex 0.

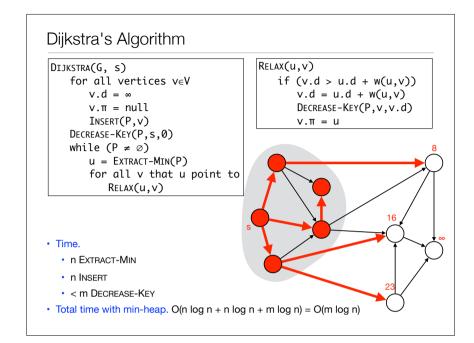

### Dijkstra's Algorithm

- Implementation. How do we implement Dijkstra's algorithm?
- Challenge. Find vertex with smallest distance estimate.

# <text><list-item><list-item>

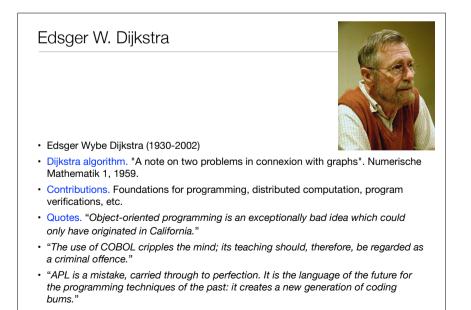

### Dijkstra's Algorithm

- Priority queues and Dijkstra's algorithm. Complexity of Dijkstra's algorithm depend on priority queue.
- n INSERT
- n EXTRACT-MIN
- < m DECREASE-KEY

Priority queue	INSERT	EXTRACT-MIN	DECREASE-KEY	Total
array	O(1)	O(n)	O(1)	O(n²)
binary heap	O(log n)	O(log n)	O(log n)	O(m log n)
Fibonacci heap	O(1)†	O(log n)†	O(1)†	O(m + n log n)

† = amortized

• Greed. Dijkstra's algorithm is a greedy algorithm.

### Shortest Paths on DAGs

- Challenge. Is it computationally easier to find shortest paths on DAGs?
- DAG shortest path algoritme.
  - Process vertices in topological order.
  - For each vertex v, relax all edges from v.
- Also works for negative edge weights.

## Shortest Paths Variants

#### Vertices

- Single source.
- Single source, single target.
- All-pairs.

#### • Edge weights.

- Non-negative.
- Arbitrary.
- Euclidian distances.

#### · Cycles.

- No cycles
- No negative cycles.
