Sequence Alignment

Sequence alignment

- How similar are ACAAGTC and CATGT.
- Align them such that
 - all items occurs in at most one pair.
 - no crossing pairs.
- Cost of alignment
 - gap penalty δ
 - mismatch cost for each pair of letters $\alpha(p,q)$.
- Goal: find minimum cost alignment.

Sequence Alignment

- Subproblem property.

- $SA(X_i, Y_j) = \min$ cost of aligning strings $X[1 \dots i]$ and $Y[1 \dots j]$.
- **Case 1. Align x_i and y_j .**
 - Pay mismatch cost for x_i and y_j + min cost of aligning X_{i-1} and Y_{j-1} .
- **Case 2. Leave x_i unaligned.**
 - Pay gap cost + min cost of aligning X_{i-1} and Y_j .
- **Case 3. Leave y_j unaligned.**
 - Pay gap cost + min cost of aligning X_i and Y_{j-1} .

Sequence alignment

- Use dynamic programming to compute an optimal alignment.
 - Time: $\Theta(mn)$
 - Space: $\Theta(mn)$
- Find actual alignment by backtracking (or saving information in another matrix).
- Linear space?
 - Easy to compute value (save last and current row)
 - How to compute alignment? Hirschberg. (not part of the curriculum).

 - Distance tables in an atlas
 - Fastest routing in a network
 - Shortest wiring on a circuit board

All-Pairs Shortest Paths

- All-Pairs Shortest Path Problem (APSP)

- Given directed weighted graph $G=(V,E)$.
- Weights of edges w_{ij} are real numbers (might be negative).
- Let $n = |V|$ and $m = |E|$.
- Weight of a path is the sum of the weights on its edges.
- **Goal:** Compute the shortest path for every pair of vertices.
- **Output:** An $n \times n$ matrix $D = D = (d_{ij})$ of shortest path distances.

- Example

	1	2	3	4
1	0	6	8	-1
2	-2	0	2	-3
3	-4	2	0	-5

All-Pairs Shortest Paths

- Assume G given as adjacency matrix of weights, with vertices numbered 1 to n .

$$w_{ij} = \begin{cases} 0 & \text{if } i = j \\ \text{weight of } (i, j) & \text{if } i \neq j, (i, j) \in E \\ \infty & \text{if } i \neq j, (i, j) \notin E \end{cases}$$

- Dynamic programming.
- Optimal substructure: Subpaths of shortest paths are shortest paths
- Let $l_{ij}^{(m)}$ be the weight of the shortest path from i to j that contains *at most* m edges.
- $m = 0$: there is a shortest path from i to j with at most 0 edges iff $i = j$:

$$l_{ij}^{(0)} = \begin{cases} 0 & \text{if } i = j \\ \infty & \text{if } i \neq j, (i, j) \notin E \end{cases}$$

- $m \geq 1$:
