

# Range Minimum Queries and Lowest Common Ancestor

---

Inge Li Gørtz

## Range Minimum Queries

---

- [Range minimum query problem](#). Preprocess array  $A[1\dots n]$  of integers to support
  - $\text{RMQ}(i,j)$ : return the (entry of) minimum element in  $A[i\dots j]$ .

0	1	2	3	4	5	6	7	8	9
1	7	12	8	2	5	1	4	8	3

- $\text{RMQ}(2,5) = 2$  (index 4)
- Basic (extreme) solutions
  - [Linear search](#):
    - Space:  $O(n)$ . Only keep array (no extra space)
    - Time:  $O(j-i) = O(n)$
  - [Save all possible answers](#): Precompute and save all answers in a table.
    - Space:  $O(n^2)$  pairs  $\Rightarrow O(n^2)$  space
    - Time:  $O(1)$

## Range Minimum Queries and Lowest Common Ancestor

---

- Range Minimum Queries (RMQ) and Lowest Common Ancestor (LCA)
- RMQ
  - Simple solutions
  - Better solution
  - 2-level solution
- Reduction between RMQ and LCA
- Dynamic RMQ

## Lowest Common Ancestor

---

- [Lowest common ancestor problem](#). Preprocess rooted tree  $T$  with  $n$  nodes to support
  - $\text{LCA}(u,v)$ : return the lowest common ancestor of  $u$  and  $v$ .

## Lowest Common Ancestor

- Basic (extreme) solutions
  - **Linear search:** Follow paths to root and mark when you visit a node.
    - Space:  $O(n)$ . Only keep tree (no extra space)
    - Time:  $O(\text{depth of tree}) = O(n)$
  - **Save all possible answers:** Precompute and save all answers in a table.
    - Space:  $O(n^2)$  pairs  $\Rightarrow O(n^2)$  space
    - Time:  $O(1)$

## RMQ and LCA

- **Outline.**
  - Can solve both RMQ and LCA in linear space and constant time.
    - First solution to RMQ
    - Solution to a special case of RMQ.
    - See that RMQ and LCA are equivalent (can reduce one to the other both ways).

## RMQ

Sparse table solution

## RMQ: Sparse table solution

- Save the result for all intervals of length a power of 2.

	0	1	2	3	4
0	1	1	1	1	1
1	3	3	3	1	
2	4	4	1	1	
3	8	6	1	1	
4	6	1	1	1	
5	1	1	1	1	
6	4	2	2	1	
7	2	2	2	1	
8	3	3	3	1	
9	9	7	4		
10	7	5	1		
11	5	4	1		
12	4	1	1		
13	1	1			
14	5	3			
15	3				

## RMQ: Sparse table solution

- Save the result for all intervals of length a power of 2.

	0	1	2	3	4
0	1	1	1	1	1
1	3	3	3	1	
2	4	4	1	1	
3	8	6	1	1	
4	6	1	1	1	
5	1	1	1	1	
6	4	2	2	1	
7	2	2	2	1	
8	3	3	3	1	
9	9	7	4		
10	7	5	1		
11	5	4	1		
12	4	1	1		
13	1	1	1		
14	5	3			
15	3				

- Space:  $O(n \log n)$

## RMQ: Sparse table solution

- Save the result for all intervals of length a power of 2.

RMQ(6, 12) = ?

	0	1	2	3	4
0	1	1	1	1	1
1	3	3	3	1	
2	4	4	1	1	
3	8	6	1	1	
4	6	1	1	1	
5	1	1	1	1	
6	4	2	2	1	
7	2	2	2	1	
8	3	3	3	1	
9	9	7	4		
10	7	5	1		
11	5	4	1		
12	4	1	1		
13	1	1	1		
14	5	3			
15	3				

- Space:  $O(n \log n)$

## RMQ: Sparse table solution

- Save the result for all intervals of length a power of 2.

RMQ(6, 12) =  $\min(\text{RMQ}(6,9), \text{RMQ}(9,12)) = \min(2,4) = 2$

	0	1	2	3	4
0	1	1	1	1	1
1	3	3	3	1	
2	4	4	1	1	
3	8	6	1	1	
4	6	1	1	1	
5	1	1	1	1	
6	4	2	2	1	
7	2	2	2	1	
8	3	3	3	1	
9	9	7	4		
10	7	5	1		
11	5	4	1		
12	4	1	1		
13	1	1	1		
14	5	3			
15	3				

- Space:  $O(n \log n)$

## RMQ: Sparse table solution

- Query:

- Any interval is the union of two power of 2 intervals.
  - $k$  largest number such that  $2^k \leq j - i + 1$ .
- Lookup results for the two intervals and take minimum.
- Time:  $O(1)$
- Space:  $O(n \log n)$
- Preprocessing time:  $O(n \log n)$ 
  - To compute results for length  $2^i$  use results for length  $2^{i-1}$ .

## ±1RMQ

---

## ±1RMQ

---

- Divide A into blocks of size  $\frac{1}{2} \log n$

- 2-level data structure:
  - Sparse table on blocks
  - Tabulation inside blocks.

## RMQ: Linear space

---

- Consider ±1RMQ: consecutive entries differ by 1.

0	1	2	3	4	5	6	7	8	9	10	11	12
4	5	6	5	4	3	2	3	2	3	4	5	4

- 2-level solution: Combine
  - $O(n \log n)$  space,  $O(1)$  time
  - $O(n^2)$  space,  $O(1)$  time.
- $O(n)$  space,  $O(1)$  time.

## ±1RMQ

---

- Divide A into blocks of size  $\frac{1}{2} \log n$

- 2-level data structure:
  - Sparse table on blocks
  - Tabulation inside blocks.

### ±1RMQ

- Divide A into blocks of size  $\frac{1}{2} \log n$

- 2-level data structure:
  - Sparse table on blocks
  - Tabulation inside blocks.

### ±1RMQ

- Divide A into blocks of size  $\frac{1}{2} \log n$

- 2-level data structure:
  - Sparse table on blocks
  - Tabulation inside blocks.
- RMQ(x,y) = min{ RMQ on blocks i to j, RMQ inside block i-1, RMQ inside block j+1 }.

### ±1RMQ: Data structure on blocks

- Two new arrays.
  - Array A': minimum from each block
  - B: position in A where A'[i] occurs.

- Sparse table data structure on A'.
- Space:  $O(|A'| \log |A'|) = O\left(\frac{n}{\log n} \cdot \log \frac{n}{\log n}\right) = O(n)$ .
- Time:  $O(1)$

### ±1RMQ: Data structure inside blocks

- Precompute and save all answers for each block.
- Gives solution using
  - Space:  $O(n)$  + space for precomputed tables.
  - Time:  $O(1) + O(1) + O(1) = O(1)$ .

## ±1RMQ: Storing the precomputed tables

- Naively:  $\log^2 n$  for each table  $\Rightarrow n \log n$  space. 😊
- **Observation:** If  $X[i] = Y[i] + c$  then all RMQ answers are the same for  $X$  and  $Y$ .
  - $X = [7, 6, 5, 6, 5, 4]$
  - $Y = [3, 2, 1, 2, 1, 0]$
- Describe block by sequence of +1s and -1s:
  - $X - Y = [-1, -1, +1, -1, -1]$ .
- How many different block descriptions are there?
  - length of sequence =  $\frac{1}{2} \log n - 1$
  - #sequences =  $2^{\frac{1}{2} \log n - 1} \leq \sqrt{n}$ .

## ±1RMQ: Data structure inside blocks

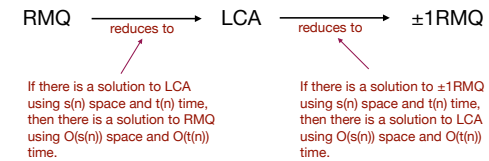

- Precompute and save all answers for each normalized block.
- Size of a table:  $O(\log^2 n)$
- For each block save which precomputed table it uses.

- Space:  $O(\sqrt{n} \cdot \log^2 n) + O(n/\log n) = O(n)$
- Plugging into 2-level solution:
  - Space:  $O(n)$  + space for precomputed tables =  $O(n)$ .

## RMQ and LCA

- We will show

## LCA and RMQ

### RMQ to LCA: Cartesian Tree

0	1	2	3	4	5	6	7	8	9
1	7	12	8	2	5	1	4	8	3

### RMQ to LCA: Cartesian Tree

0	1	2	3	4	5	6	7	8	9
1	7	12	8	2	5	1	4	8	3

• RMQ(2,5)

### RMQ to LCA: Cartesian Tree

0	1	2	3	4	5	6	7	8	9
1	7	12	8	2	5	1	4	8	3

•  $RMQ(2,5) = LCA(2,5)$

### LCA to ±1RMQ

• E =

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16
7	4	0	4	1	3	2	3	8	3	1	4	6	4	7	5	7

• A =

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16

## RMQ and LCA

---

- **Theorem.** RMQ and LCA can be solved in  $O(n)$  space and  $O(1)$  query time.
