# Introduction to Data Structures

---

- Data Structures
- Stacks and Queues
- Linked Lists
- Dynamic Arrays

# Data Structures

---

- **Data structure.** Method for organizing data for efficient access, searching, manipulation, etc.
- **Goal.**
  - Fast.
  - Compact
- **Terminology.**
  - **Abstract** vs. **concrete** data structure.
  - **Dynamic** vs. **static** data structure.

# Introduction to Data Structures

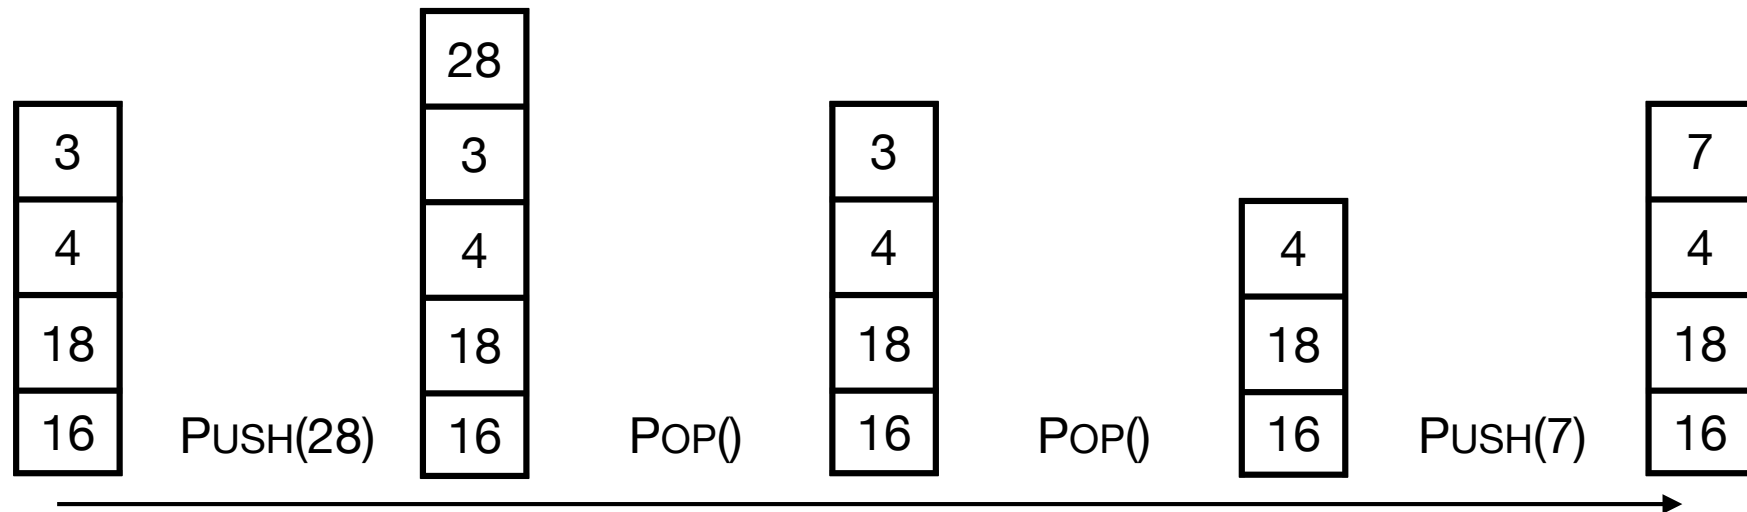

---

- Data Structures
- **Stacks and Queues**
- Linked Lists
- Dynamic Arrays

# Stack

---

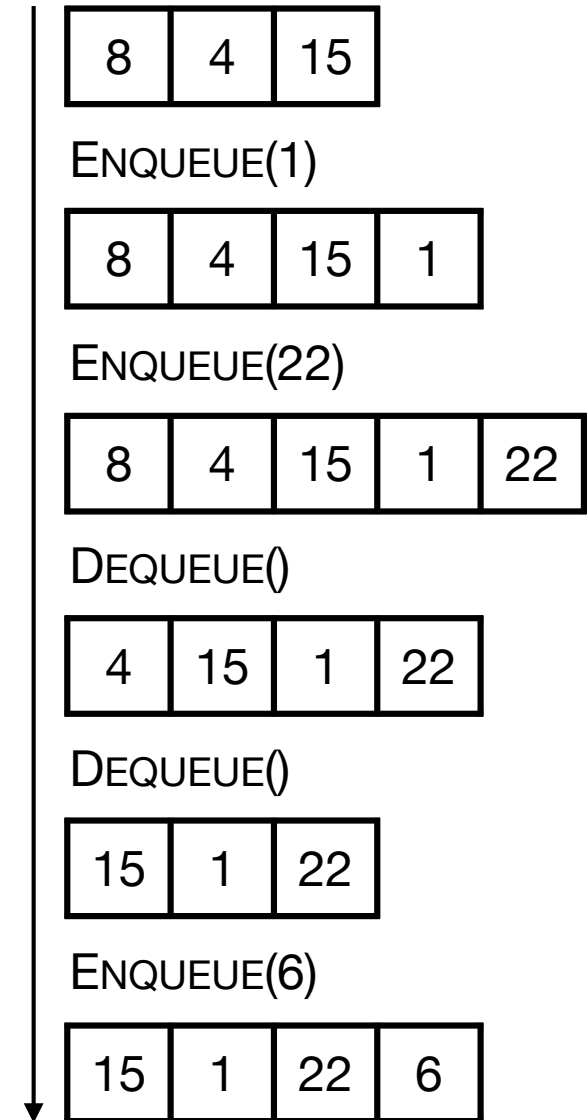

- **Stack.** Maintain dynamic sequence (stack) S supporting the following operations:
  - PUSH(x): add x to S.
  - POP(): remove and return the **most recently** added element in S.
  - ISEMPTY(): return true if S is empty.

# Queue

---

- **Queue**. Maintain dynamic sequence (queue) Q supporting the following operations:
  - ENQUEUE(x): add x to Q.
  - DEQUEUE(): remove and return the **earliest added** element in Q.
  - ISEMPTY(): return true if Q is empty.

# Applications

---

- Stacks.

- Virtual machines
- Parsing
- Function calls
- Backtracking

- Queues.

- Scheduling processes
- Buffering
- Breadth-first searching

# Stack Implementation

---

- **Stack.** Stack with **capacity** N
- **Data structure.**
  - Array  $S[0..N-1]$
  - Index  $top$ . Initially  $top = -1$
- **Operations.**
  - $PUSH(x)$ : Add  $x$  at  $S[top+1]$ ,  $top = top + 1$
  - $POP()$ : return  $S[top]$ ,  $top = top - 1$
  - $ISEMPTY()$ : return true if  $top = -1$ .
  - Check for overflow and underflow in  $PUSH$  and  $POP$ .

# Stack Implementation

---

- Time
  - PUSH in  $O(1)$  time.
  - POP in  $O(1)$  time.
  - ISEMPY in  $O(1)$  time.
- Space.
  - $O(N)$  space.
- Limitations.
  - Capacity must be known.
  - Wasting space.

# Queue Implementation

---

- Time.
  - ENQUEUE in  $O(1)$  time.
  - DEQUEUE in  $O(1)$  time.
  - ISEMPY in  $O(1)$  time.
- Space.
  - $O(N)$  space.
- Limitations.
  - Capacity must be known.
  - Wasting space.

# Stacks and Queues

---

- Stack.

- **Time.** PUSH, POP, ISEEMPTY in  $O(1)$  time.
- **Space.**  $O(N)$

- Queue.

- **Time.** ENQUEUE, Dequeue, ISEEMPTY in  $O(1)$  time.
- **Space.**  $O(N)$

- **Challenge.** Can we get linear space and constant time?

# Introduction to Data Structures

---

- Data Structures
- Stacks and Queues
- **Linked Lists**
- Dynamic Arrays

# Linked Lists

---

- **Linked lists.**

- Data structure to maintain **dynamic** sequence of elements in linear space.
- Sequence order determined by pointers/references called **links**.
- Fast insertion and deletion of elements and contiguous sublists.
- **Singly-linked** vs **doubly-linked**.

# Linked Lists

- Doubly-linked lists in Java.

```
class Node {  
    int key;  
    Node next;  
    Node prev;  
}  
  
Node head = new Node();  
Node b = new Node();  
Node c = new Node();  
head.key = 7;  
b.key = 42;  
c.key = 18;  
  
head.prev = null;  
head.next = b;  
b.prev = head;  
b.next = c;  
c.prev = b;  
c.next = null;
```

# Linked Lists

- Simple operations.
  - SEARCH(head, k): return node with key k. Return null if it does not exist.
  - INSERT(head, x): insert node x in front of list. Return new head.
  - DELETE(head, x): delete node x in list.

# Linked Lists

- Operations in Java.

```
Node Search(Node head, int value) {  
    Node x = head;  
    while (x != null) {  
        if (x.key == value) return x;  
        x = x.next;  
    }  
    return null;  
}
```

```
Node Insert(Node head, Node x) {  
    x.prev = null;  
    x.next = head;  
    head.prev = x;  
    return x;  
}
```

```
Node Delete(Node head, Node x) {  
    if (x.prev != null)  
        x.prev.next = x.next;  
    else head = x.next;  
    if (x.next != null)  
        x.next.prev = x.prev;  
    return head;  
}
```

- Ex.** Let p be a new with key 10 and let q be node with key 23 in list. Trace execution of Search(head, 18), Insert(head, p) og Delete(head, q).

# Linked Lists

---

- **Time.**
  - SEARCH in  $O(n)$  time.
  - INSERT and DELETE in  $O(1)$  time.
- **Space.**
  - $O(n)$

# Stack and Queue Implementation

---

- **Ex.** Consider how to implement stack and queue with linked lists efficiently.
- **Stack.** Maintain dynamic sequence (stack) S supporting the following operations:
  - PUSH(x): add x to S.
  - POP(): remove and return the **most recently** added element in S.
  - ISEMPTY(): return true if S is empty.
- **Queue.** Maintain dynamic sequence (queue) Q supporting the following operations:
  - ENQUEUE(x): add x to Q.
  - DEQUEUE(): remove and return the **earliest added** element in Q.
  - ISEMPTY(): return true if S is empty.

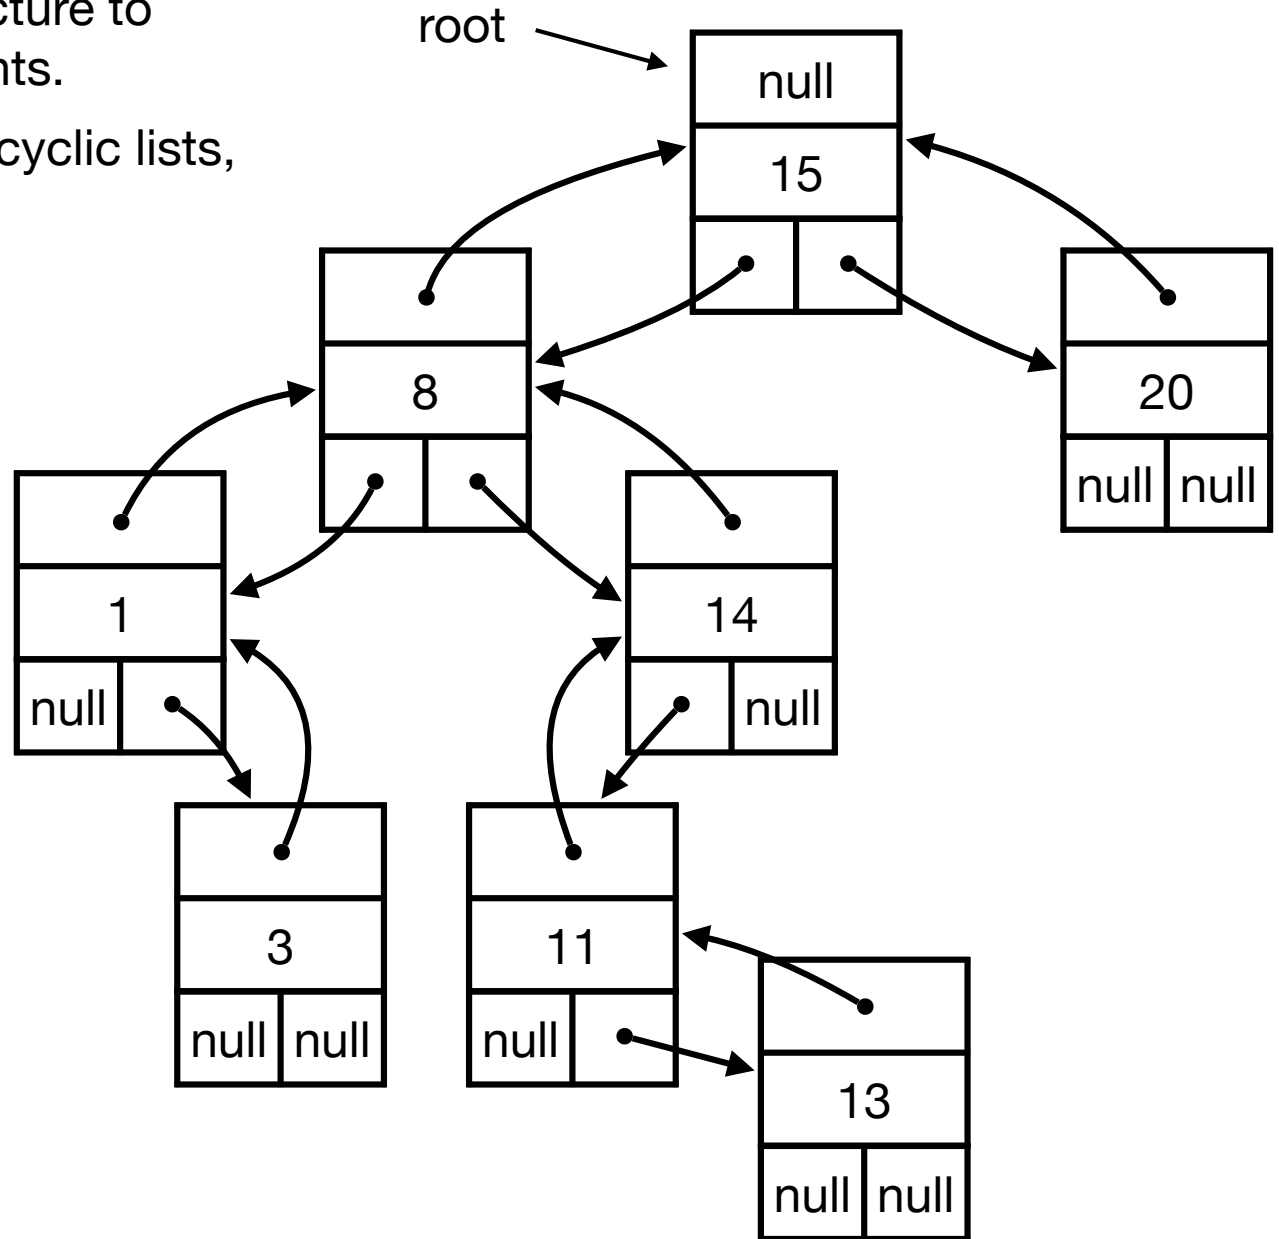

# Stack and Queue Implementation

---

- Stacks and queues using linked lists
- Stack.
  - **Time.** PUSH, POP, ISEEMPTY in  $O(1)$  time.
  - **Space.**  $O(n)$
- Queue.
  - **Time.** ENQUEUE, DEQUEUE, ISEEMPTY in  $O(1)$  time.
  - **Space.**  $O(n)$

# Linked Lists

- **Linked list.** Flexible data structure to maintain sequence of elements.
- Other linked data structures: cyclic lists, trees, graphs, ...

# Introduction to Data Structures

---

- Data Structures
- Stacks and Queues
- Linked Lists
- **Dynamic Arrays**

# Stack Implementation with Array

---

- **Challenge.** Can we implement a stack efficiently with arrays?
  - Do we need a fixed capacity?
  - Can we get linear space and constant time?

# Dynamic Arrays

---

- **Goal.**
  - Implement a stack using arrays in  $O(n)$  space for  $n$  elements.
  - As fast as possible.
  - Focus on PUSH. Ignore POP and ISEEMPTY for now.
- **Solution 1**
  - Start with array of size 1.
- PUSH(x):
  - Allocate new array of size + 1.
  - Move all elements to new array.
  - Delete old array.

# Dynamic Arrays

---

- PUSH(x):
  - Allocate new array of size + 1.
  - Move all elements to new array.
  - Delete old array.
- **Time.** Time for n PUSH operations?
  - ith PUSH takes  $O(i)$  time.
  - $\Rightarrow$  total time is  $1 + 2 + 3 + 4 + \dots + n = O(n^2)$
- **Space.**  $O(n)$
- **Challenge.** Can we do better?

# Dynamic Arrays

---

- **Idea.** Only copy elements some times
- **Solution 2.**
  - Start with array of size 1.
- **PUSH(x):**
  - If array is **full**:
    - Allocate new array of **twice the size.**
    - Move all elements to new array.
    - Delete old array.

# Dynamic Arrays

---

- PUSH(x):
  - If array is **full**:
    - Allocate new array of **twice the size**.
    - Move all elements to new array.
    - Delete old array.
- **Time**. Time for n PUSH operations?
  - PUSH  $2^k$  takes  $O(2^k)$  time.
  - All other PUSH operations take  $O(1)$  time.
  - $\Rightarrow$  total time  $< 1 + 2 + 4 + 8 + 16 + \dots + 2^{\log n} + n = O(n)$
- **Space**.  $O(n)$

# Dynamic Arrays

---

- Stack with dynamic array.
  - $n$  PUSH operations in  $O(n)$  time and space.
  - Extends to  $n$  PUSH, POP og ISEEMPTY operations in  $O(n)$  time.
- Time is **amortized**  $O(1)$  per operation.
- With more clever tricks we can **deamortize** to get  $O(1)$  worst-case time per operation.
  
- Queue with dynamic array.
  - Similar results as stack.
- Global rebuilding.
  - Dynamic array is an example of **global rebuilding**.
  - Technique to make static data structures dynamic.

# Stack and Queues

Data structure	PUSH	POP	ISEMPTY	Space
Array with capacity N	$O(1)$	$O(1)$	$O(1)$	$O(N)$
Linked List	$O(1)$	$O(1)$	$O(1)$	$O(n)$
Dynamic Array 1	$O(n)$	$O(1)^\dagger$	$O(1)$	$O(n)$
Dynamic Array 2	$O(1)^\dagger$	$O(1)^\dagger$	$O(1)$	$O(n)$
Dynamic Array 3	$O(1)$	$O(1)$	$O(1)$	$O(n)$

† = **amortized**
