

# k-center

## The k-center problem

- **Input.** An integer  $k$  and a complete, undirected graph  $G=(V,E)$ , with distance  $d(i,j)$  between each pair of vertices  $i,j \in V$ .
- $d$  is a metric:
  - $\text{dist}(i,i) = 0$
  - $\text{dist}(i,j) = \text{dist}(j,i)$
  - $\text{dist}(i,l) \leq \text{dist}(i,j) + \text{dist}(j,l)$
- **Goal.** Choose a set  $S \subseteq V$ ,  $|S| = k$ , of  $k$  centers so as to minimize the maximum distance of a vertex to its closest center.

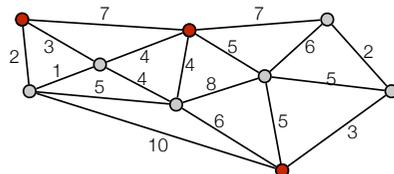

$$S = \text{argmin}_{S \subseteq V, |S|=k} \max_{i \in V} \text{dist}(i,S)$$

- **Covering radius.** Maximum distance of a vertex to its closest center.

## k-center: Greedy algorithm

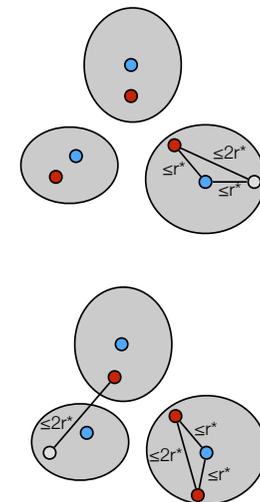

- **Greedy algorithm.**
  - Pick arbitrary  $i$  in  $V$ .
  - Set  $S = \{i\}$
  - while  $|S| < k$  do
    - Find vertex  $j$  farthest away from any cluster center in  $S$
    - Add  $j$  to  $S$

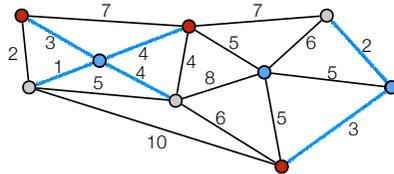

- Greedy is a 2-approximation algorithm:
  - polynomial time ✓
  - valid solution ✓
  - factor 2

## k-center: analysis greedy algorithm

- $r^*$  optimal radius.
- Show all vertices within distance  $2r^*$  from a center.
- Consider optimal clusters. 2 cases.
  - Algorithm picked one center in each optimal cluster
    - distance from any vertex to its closest center  $\leq 2r^*$  (triangle inequality)
- Some optimal cluster does not have a center.
  - Some cluster have more than one center.
  - distance between these two centers  $\leq 2r^*$ .
  - when second center in same cluster picked it was the vertex farthest away from any center.
  - distance from any vertex to its closest center at most  $2r^*$ .

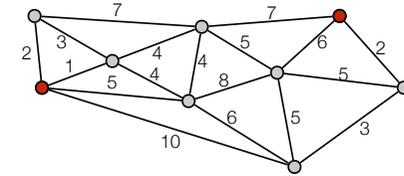

## k-center

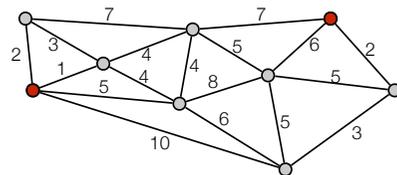

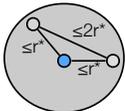

## Bottleneck algorithm

- Assume we know the optimum covering radius  $r$ .
- Example:  $k=3$ .  $r=4$ .

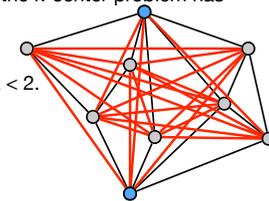

## Bottleneck algorithm

- Assume we know the optimum covering radius  $r$ .
- Example:  $k=3$ .  $r=4$ .
- Analysis.
  - Covering radius is at most 2.
  - Algorithm picks more than  $k$  centers  $\Rightarrow$  the optimum covering radius is  $> r$ .
    - If algorithm pick more than  $k$  centers then it picked more than one in some OPT cluster.
    - If  $r^* \leq r$  we can pick at most one in each optimum cluster.
- Can “guess” optimal covering radius (only a polynomial number of possible values).

## k-center: Inapproximability

- There is no  $\alpha$ -approximation algorithm for the  $k$ -center problem for  $\alpha < 2$  unless  $P=NP$ .
- **Proof.** Reduction from dominating set.
- *Dominating set.* Given  $G=(V,E)$  and  $k$ . Is there a (dominating) set  $S \subseteq V$  of size  $k$ , such that each vertex is either in  $S$  or adjacent to a vertex in  $S$ ?
- Given instance of the dominating set problem construct instance of  $k$ -center problem:
  - Complete graph  $G'$  on  $V$ .
  - All edges from  $E$  has weight 1, all new edges have weight 2.
  - Radius in  $k$ -center instance 1 or 2.
  - $G$  has an dominating set of size  $k \Leftrightarrow$  opt solution to the  $k$ -center problem has radius 1.
- Use  $\alpha$ -approximation algorithm  $A$ :
  - $\text{opt} = 1 \Rightarrow A$  returns solution with radius at most  $\alpha < 2$ .
  - $\text{opt} = 2 \Rightarrow A$  returns solution with radius 2.
  - Can use  $A$  to distinguish between the 2 cases.

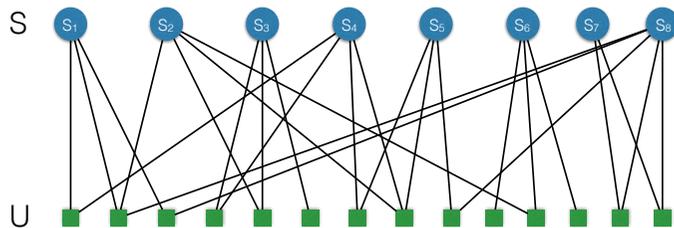

# Set cover

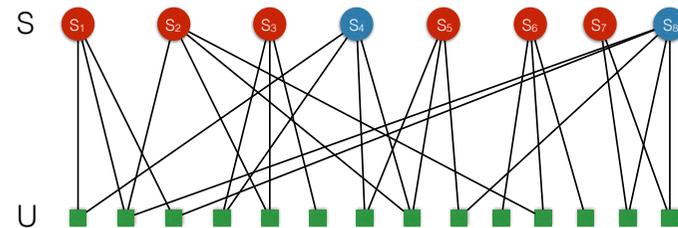

## Set cover problem

- Set  $U$  of  $n$  elements.
- Subsets of  $U$ :  $S_1, \dots, S_m$ .
- Each set  $S_i$  has a weight  $w_i \geq 0$ .
- **Set cover.** A collection of subsets  $C$  whose union is equal to  $U$ .
- **Goal.** find set cover of minimum weight.

### Set Cover: Greedy algorithm

### Set cover: greedy algorithm

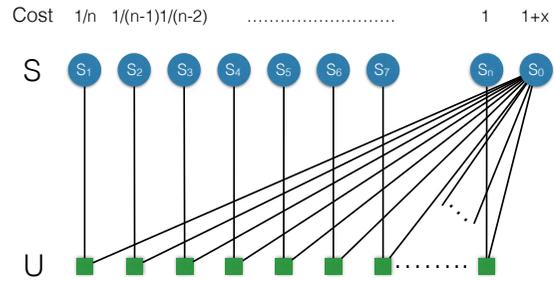

```

Greedy-set-cover
Set R := U and C := ∅
while R ≠ ∅
  Select the set Si minimizing  $\frac{w_i}{|S_i \cap R|}$ 

  Delete the elements from Si from R.
  Add Si to C.
endwhile
Return C.
    
```

- Greedy-set-cover is a  $n O(\log n)$ -approximation algorithm:
  - polynomial time ✓
  - valid solution ✓
  - factor  $O(\log n)$
