

# 02465: Introduction to reinforcement learning and control

Dynamical Programming

Tue Herlau

DTU Compute, Technical University of Denmark (DTU)

### Lecture Schedule

- 1 The finite-horizon decision problem
- Dynamical Programming
- 3 DP reformulations and introduction to Control

- 4 Discretization and PID control
- 6 Direct methods and control by optimization
- 6 Linear-quadratic problems in control
- Linearization and iterative LQR

- 8 Exploration and Bandits
- Policy and value iteration
- Monte-carlo methods and TD learning
- Model-Free Control with tabular and linear methods
- Eligibility traces and value-function approximations
- Q-learning and deep-Q learning

2 DTU Compute Lecture 2 7 February, 2025

14 March Syllabus: https://02465material.pages.compute.dtu.dk/02465public Help improve lecture by giving feedback on DTU learn

DTU

### Reading material:

• [Her24, Chapter 5-6.2] Formalization of the decision problem and the DP algorithm

# Learning Objectives

- Dynamical Programming
- Principle of optimality
- Optimal policy/value function using DP

3 DTU Compute

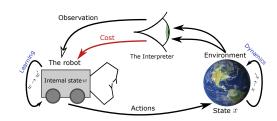

Lecture 2 7 February, 2025

The decision problem

DTU

DTU

State The configuration of the environment  $\boldsymbol{x}$ Action What we do  $\boldsymbol{u}$ 

Cost/reward A number which depends on the state and action

4 DTU Compute Lecture 2 7 February, 2025

# Example: Shortest path graph traversal

Find shortest path from starting node  $x_0=2$  to final node  $t=5\,$ 

State Current node  $x_k = 4$ 

Actions next possible node:  $u_k \in \{1, 2, \dots, 5\}$ 

Dynamics Deterministic, known

$$x_{k+1} = f(x_k = 4, u_k = 5) = 5$$

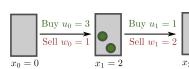

Cost Sum of edge weights

$$\sum_{k=0}^{N-1} a_{x_k,u_k} + \begin{cases} 0 & \text{if } x_N = t \\ \infty & \text{otherwise} \end{cases}$$

We want optimal path  $\{2,3,4,5\}$ 

5 DTU Compute Lecture 2 7 February, 2025

# Inventory control

ullet We order a quantity of an item at period  $k=0,\dots,N$  so as to meet a stochastic demand

 $oldsymbol{x_k}$  stock available at the beginning of the kth period,

 $u_k \geq 0$  stock ordered (and immediately delivered) at the beginning of the kth period.

 $w_k \geq 0$  Demand during the k'th period

- Dynamics:  $x_{k+1} = x_k + u_k w_k$
- Cost per new unit c; cost to hold  $x_k$  units is  $r(x_k)$

$$r(x_k) + cu_k$$

ullet Select actions  $u_0,\dots,u_{N-1}$  to minimize cost

We want proven optimal rule for ordering

6 DTU Compute Lecture 2 7 February, 2025

# DTU

### Basic control setup: Environment dynamics

Finite time Problem starts at time 0 and terminates at fixed time N. Indexed as  $k = 0, 1, \dots, N$ .

State space The states  $x_k$  belong to the **state space**  $\mathcal{S}_k$ 

Control The available controls  $u_k$  belong to the action space  $A_k(x_k)$ , which may depend on  $x_k$ 

Dynamics

$$x_{k+1} = f_k(x_k, u_k, w_k), \quad k = 0, 1, \dots, N-1$$

Disturbance/noise A random quantity  $w_k$  with distribution

$$w_k \sim P_k(W_k|x_k,u_k)$$

7 DTU Compute Lecture 2 7 February, 2025

### Cost and control

Agent observe  $x_k$ , agent choose  $u_k$ , environment generates  $w_k$  $\operatorname{\mathsf{Cost}}$  At each stage k we obtain cost

$$g_k(x_k, u_k, w_k), \quad k = 0, \dots, N-1$$
 and  $g_N(x_k)$  for  $k = N$ .

Action choice Chosen as  $u_k=\mu_k(x_k)$  using a function  $\mu_k:\mathcal{S}_k\to\mathcal{A}_k(x_k)$ 

$$\mu_k(x_k) = \{ \text{Action to take in state } x_k \text{ in period } k \}$$

Policy The collection  $\pi = \{\mu_0, \mu_1, \dots, \mu_{N-1}\}$ 

Rollout of policy Given  $x_0$ , select  $u_k = \mu_k(x_k)$  to obtain a **trajectory**  $x_0, u_0, x_1, \dots, x_N$  and accumulated cost

$$g_{N}(x_{N}) + \sum_{k=0}^{N-1} g_{k}(x_{k}, \mu_{k}(x_{k}), w_{k})$$

8 DTU Comput

# Expected cost/value function

Expected cost Given  $\pi$ ,  $x_0$  it is the average cost of all trajectories:

$$J_{\pi}(x_{0}) = \mathbb{E}\left[g_{N}(x_{N}) + \sum_{k=0}^{N-1} g_{k}(x_{k}, \mu_{k}(x_{k}), w_{k})\right]$$

Optimal policy Given  $x_0$ , an optimal policy  $\pi^*$  is one that minimizes the

$$\pi^*(x_0) = \underset{\pi = \{\mu_0, \dots, \mu_{N-1}\}}{\arg \min} J_{\pi}(x_0)$$

Optimal cost function The optimal cost, given  $x_0$ , is denoted  $J^*(x_0)$  and is defined as

$$J^*(x_0) = \min_{\pi = \{\mu_0, \dots, \mu_{N-1}\}} J_{\pi}(x_0)$$

 $J_{\pi}$  is the key quantity in control/reinforcement learning

9 DTU Compute

Lecture 2 7 February, 2025

# Open versus closed loop

DTU

Our goal is to find the policy  $\boldsymbol{\pi}$  which minimize:

$$J_{\pi}\left(x_{0}\right)=\mathbb{E}\left[g_{N}\left(x_{N}\right)+\sum_{k=0}^{N-1}g_{k}\left(x_{k},\mu_{k}\left(x_{k}\right),w_{k}\right)\right]$$

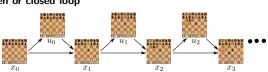

Closed-loop minimization Select  $u_k$  last-minute as  $u_k = \mu_k(x_k)$  when information  $\boldsymbol{x}_k$  is available

Open-loop minimization Select actions  $u_0, \ldots, u_{N-1}$  at k=0

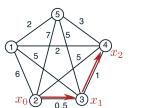

Open-loop minimization is simpler

10 DTU Compute Lecture 2 7 February, 2025

# Open or closed loop

- If environment is stochastic, we need a closed-loop controller
- If environment is deterministic, we know the position  $x_k$  with certainty given  $u_0, \ldots, u_{k-1}$ . Therefore, there is no advantage in delaying choice

11 DTU Compute

Lecture 2 7 February, 2025

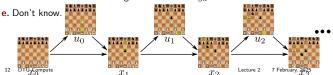

# Quiz: Chess and DP

Suppose the game of chess was formulated as dynamical programming (N,  $\mathcal{S}_k,\,\mathcal{A}_k,\,$  etc.) with the intention of obtaining a good policy  $\mu_k$  using dynamical programming.

This will lead to several practical problems, however, focusing just on the potential problems listed below, which one will be a main obstacle?

- a. The policy function  $\mu_k$  will require too much memory to store
- **b.** Given a state  $x_k$ , it is not practical to define the action spaces  $\mathcal{A}_k(x_k)$
- **c.** It will require too much space to store the state space  $S_2$ .
- **d.** We cannot define a meaningful cost function  $g_k$ .

# Summary: Discrete stochastic decision problem

- $w_k \sim P_k(W_k = w_k | x_k, u_k)$ ,  $k = 0, \dots, N-1$  are random disturbances
- The system evolves as

$$x_{k+1} = f_k(x_k, \mu_k(x_k), w_k), \quad k = 0, \dots, N-1$$

- At time k, the possible states/actions are  $x_k \in S_k$  and  $u_k \in \mathcal{A}_k(x_k)$
- Policy is a sequence of functions  $\pi = \{\mu_0, \dots, \mu_{N-1}\}, \ \mu_k : S_k \mapsto \mathcal{A}_k(x_k)$
- ullet The cost starting in  $x_0$  is:

$$J_{\pi}\left(x_{0}\right)=\mathbb{E}\left[g_{N}\left(x_{N}\right)+\sum_{k=0}^{N-1}g_{k}\left(x_{k},\mu_{k}\left(x_{k}\right),w_{k}\right)\right]$$

• The control problem: Given  $x_0$ , determine optimal policy by minimizing

$$\pi^*(x_0) = \underset{\pi = \{\mu_0, \dots, \mu_{N-1}\}}{\arg \min} J_{\pi}(x_0)$$

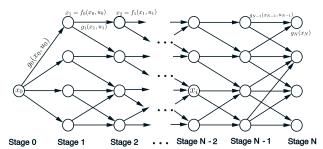

13 DTU Compute Lecture 2 7 February, 20

### Principle of optimalit

DTU

# **Graph representation**

Starting in  $x_0$ , decision problem can be seen as traversing a graph

DTU

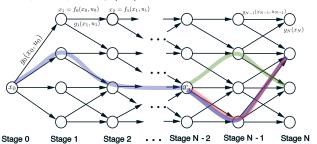

DTU

- Nodes are states, edges are possible transitions, cost is sum of edges
- In deterministic case, actions are edges and a policy is just a path

14 DTU Compute Lecture 2 7 February, 2025

### Principle of optimality

# Principle of optimality (PO), deterministic case

The **blue line** is a path corresponding to an **optimal** policy

$$J^*(x_0) = J_{\pi^*}(x_0) = \min J_{\pi}(x_0)$$

Suppose at stage i optimal path  $\pi^* = \left\{\mu_0^*, \mu_1^*, \dots, \mu_{N-1}^*\right\}$  pass through  $x_i$ 

 $\overset{\bullet}{\text{15}} \text{PO: The tail policy } \left\{ \mu_i^*, \mu_{i+1}^*, \dots, \mu_{N-1}^* \right\} \text{ is optimal from } x_{i \text{- to } x_N} \underset{\text{7 February, 2025}}{\text{to propose}} \right.$ 

### Principle of optimalit

### Definitions

For any policy  $\pi = \{\mu_0, \mu_1, \dots, \mu_{N-1}\}$ 

- For any  $k=0,\ldots,N-1$ ,  $\pi^k=\{\mu_k,\mu_{k+1},\ldots,\mu_{N-1}\}$  is a tail policy
- ullet For any  $x_k$  the cost of the tail policy is

$$J_{k,\pi}\left(x_{k}\right) = \mathbb{E}\left\{g_{N}\left(x_{N}\right) + \sum_{i=k}^{N-1} g_{i}\left(x_{i}, \mu_{i}\left(x_{i}\right), w_{i}\right)\right\}$$

 $\bullet$  And the  ${\bf optimal}$   ${\bf cost}$  of a tail policy starting in  $x_k$ 

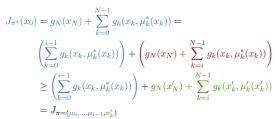

$$J_k^*\left(x_k\right) = \min_{k} J_{k,\pi_k}(x_k)$$

• Note that  $J_0^*(x_0) = J^*(x_0)$ 

16 DTU Compute Lecture 2 7 February, 2025

### Principle of optimality

# Proof of PO in deterministic case

If the optimal tail policy  $\pi_i^\prime$  had a lower tail cost than the tail of optimal relieve this measure.

$$g_N(x_N) + \sum_{k=i}^{N-1} g_k(x_k, \mu_k^*(x_k)) > g_N(x_N') + \sum_{k=i}^{N-1} g_k(x_k', \mu_k'(x_k'))$$

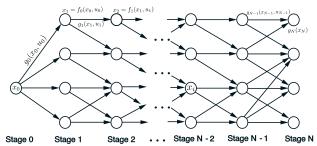

and so the combined policy  $(\mu_0,\dots,\mu_{i-1},\pi_i')$  would have lower cost than optimal policy  $\pi^*$ 

17 DTU Compute Lecture 2 7 February, 202

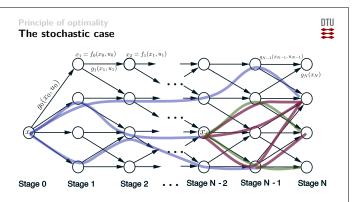

### Principle of optimality

# The stochastic case

Consider the stochastic case. Trajectories are now random

18 DTU Compute Lecture 2 7 February, 2025

- ullet Consider tail policy of  $\pi^*$ :  $J_{i,\pi^*}(x_0)$
- Suppose optimal tail policy  $J_i^*(x_i)$  is an improvement
- It seems true the combined policy is an improvement over  $\pi^*$  [Her24, appendix A]

9 DTU Compute Lecture 2 7 February, 2025

Principle of optimality

# Principle of optimality

Consider a general, stochastic/discrete finite-horizon decision problem

### The principle of optimality

Let  $\pi^* = \{\mu_0^*, \mu_1^*, \dots, \mu_{N-1}^*\}$  be an optimal policy for the problem, and assume that when using  $\pi^*$ , a given state  $x_i$  occurs at stage i with positive probability. Suppose  $\tilde{\pi}_k^*$  is the optimal tail policy obtained by minimizing the tail cost starting from  $x_i$ .

$$J_{k,\pi}\left(x_{i}\right)=\mathbb{E}\left\{ g_{N}\left(x_{N}\right)+\sum_{i=k}^{N-1}g_{i}\left(x_{i},\mu_{i}\left(x_{i}\right),w_{i}\right)\right\} .$$

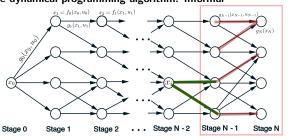

Then the truncated policy  $\left\{\mu_i^*,\mu_{i+1}^*,\dots,\mu_{N-1}^*\right\}$  of  $\pi^*$  is optimal for the tail problem

$$J_{k,\tilde{\pi}_{*,k}}\left(x_{k}\right)=J_{k,\pi^{*}}\left(x_{k}\right).$$

20 DTU Compute Lecture 2 7 February, 2025

### Principle of optimality

# The dynamical programming algorithm: Informal

- ullet Suppose we know the optimal tail policy at stage k+1 for all  $x_{k+1}$
- Cost of optimal path  $\pi_k^*$  from k to N is the cost of optimal path  $x_k \to x_{k+1}$  and then  $x_{k+1} \to x_N$
- The later part is the same as  $J_{k+1}^*(x_{k+1})$  by the PO
- We find optimal cost by minimizing

$$J_k^*(x_k) = \min_{u_k \in \mathcal{A}_k(x_k)} \left[ g_k(x_k, u_k) + J_{k+1}^*(x_{k+1}) \right], \quad \mu_k(x_k) = u_k^*$$
 Lecture 2 — 7 February, 202

### Principle of optimality

# The Dynamical Programming algorithm

DTU

# The Dynamical Programming algorithm

For every initial state  $x_0$ , the optimal cost  $J^*(x_0)$  is equal to  $J_0(x_0)$ , and optimal policy  $\pi^*$  is  $\pi^* = \{\mu_0, \dots, \mu_{N-1}\}$ , computed by the following algorithm, which proceeds backward in time from k=N to k=0 and for each  $x_k \in S_k$  computes

$$J_{N}\left(x_{N}\right) = g_{N}\left(x_{N}\right) \tag{1}$$

$$J_{k}(x_{k}) = \min_{u_{k} \in \mathcal{A}_{k}(x_{k})} \mathbb{E}_{u_{k}} \left\{ g_{k}(x_{k}, u_{k}, w_{k}) + J_{k+1} \left( f_{k}(x_{k}, u_{k}, w_{k}) \right) \right\}$$
(2)

 $\mu_k(x_k)=u_k^*$  ( $u_k^*$  is the  $u_k$  which minimizes the above expression). (3)

- $\bullet$  There are N  $\,\mu{}'{\rm s}$  and N+1  $J'{\rm s}.$  This will also be the case in the code
- In the deterministic case:

$$J_{k}(x_{k}) = \min_{u_{k} \in A_{k}(x_{k})} \left\{ g_{k}(x_{k}, u_{k}) + J_{k+1} \left( f_{k}(x_{k}, u_{k}) \right) \right\}$$

22 DTU Compute Lecture 2 7 February, 2025

### Principle of optimality

### **Example: Inventory control**

- $\bullet$  Consider the inventory control problem where we plan over  ${\cal N}=3$  stages
- $\bullet$  Customers can buy  $w_k=0$  to  $w_k=2$  units and we can order  $u_k=0$  to  $u_k=2$  units
- $\bullet$  We assume the stock can hold from 0 to 2 units (no excess stock; no backlog)

$$x_{k+1} = f_k(x_k, u_k, w_k) = x_k + u_k - w_k$$
 (threshold s.t.  $0 \le x_{k+1} \le 2$ )

 $\bullet$  The cost to buy an item is 1 plus quadratic penalty for excess stock and unmet demand:

$$u_k + (x_k + u_k - w_k)^2$$

- ullet There is no terminal cost  $g_N(x_N)=0$
- The demand has distribution

$$p(w_k = 0) = 0.1$$
,  $p(w_k = 1) = 0.7$ ,  $p(w_k = 2) = 0.2$ 

23 DTU Compute Lecture 2 7 February, 2025

### Implementation

```
1  # inventory.py
2  class InventoryDPModel(DPModel):
3    def __init__(self, N=3):
4        super().__init__(N=N)
5
6    def A(self, x, k): # Action space A_k(x)
7        return {0, 1, 2}
8
9    def S(self, k): # State space S_k
10        return {0, 1, 2}
11
12    def g(self, x, u, w, k): # Cost function g_k(x,u,w)
13        return u + (x + u - w) ** 2
14
15    def f(self, x, u, w, k): # Dynamics f_k(x,u,w)
16    return max(0, min(2, x u - w))
17
18    def Pw(self, x, u, k): # Distribution over random disturbances
19    return {0: 1, 1: 7, 2: 0. 2}
20
21    def gN(self, x):
22    return 0
```

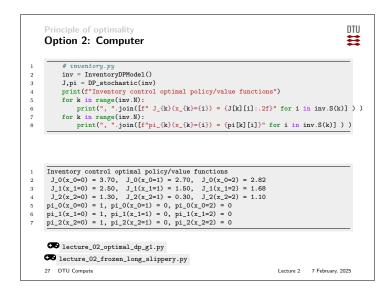

24 DTU Compute Lecture 2 7 February, 2025

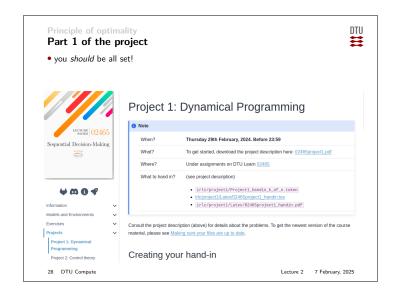

Principle of optimality  $\begin{array}{l} \text{Option 1: Pen-and-paper} \\ \\ \text{First step: } J_3\left(x_3\right) = 0 \text{ (for all } x_3 \text{)} \\ \\ \text{Step } k = 2 \text{ For } x_2 = 0 \\ \\ \\ J_2(0) = \min_{u_2 = 0, 1, 2} \mathbb{E}_{w_2} \left\{ u_2 + (u_2 - w_2)^2 \right\} \\ \\ = \min_{u_2 = 0, 1, 2} \left[ u_2 + 0.1 \left( u_2 \right)^2 + 0.7 \left( u_2 - 1 \right)^2 + 0.2 \left( u_2 - 2 \right)^2 \right] \\ \\ = \min_{u_2 = 0, 1, 2} \left\{ 0.7 \cdot 1 + 0.2 \cdot 4, 1 + 0.1 \cdot 1 + 0.2 \cdot 1, 2 + 0.1 \cdot 4 + 0.7 \cdot 1 \right\} \\ \\ = \min_{u_2 = 0, 1, 2} \left\{ 1.5, 1.3, 3.1 \right\} \\ \\ \text{Therefore } \mu_2^*(0) = 1 \text{ and } J_2^*(0) = 1.3 \\ \\ \text{Until nails bleed Keep at it for } x_2 = 1, 2 \text{ and then for } k = 1 \text{ and finally } \\ k = 0 \dots \\ \end{array}$
